UMİ — Open-Source Media Analysis

How a public institution follows the way the world sees it: 230,000 openly published articles a day, in 63 languages — all of it on its own servers.

Ten minutes, three questions

WHY?
The problem no team can out-read

Part 1
Context

- The world publishes faster than anyone can read
- What matters about you is written in a language you don't speak

WHAT & HOW?
A sovereign AI system, built in-house

Part 2
System

- Open-weight models on our own hardware
- From raw feed to a morning briefing

WHAT'S NEXT?
What we can share with this region

Part 3
Together

- Open access to the archive, and the method behind it
- The Black Sea is one information space

The problem

Nobody can read the world

Every institution that works across borders hits the same wall.

The press publishes faster than any team can read — in our case, one new article every 0.4 seconds.

Most of what is written about you is in a language nobody in the room speaks.

Translation alone is not understanding — credibility, tone and context decide what matters.

And by the time a weekly report is finished, the story has moved on.

Meanwhile, the questions being asked about that coverage are always the same four.

What is being said about us right now — and where?

Is this one outlet, or is it spreading across a region?

Does it matter enough to respond today?

Show me the evidence, not an impression.

One system, three jobs.

Collect · Understand · Deliver

An in-house platform of the Directorate of Communications. It follows how Türkiye is seen and discussed in the international press — openly published media only — and turns that into evidence a person can act on, in minutes rather than weeks.

Collect — 4,577 active sources, 42,675 publishers, 195 countries — polled continuously.

Understand — Country and language resolved separately, translation, relevance scoring, entity and sentiment extraction.

Deliver — Live feed, alerts, a world map, written analyses, an assistant and a daily audio bulletin.

Built, hosted and operated entirely on public infrastructure.

Production, not a pilot

Eight weeks, eight million articles

7.99 M
articles collected

230 K
new articles every day

195
countries covered

63
languages read

1.10 M
machine translations

1.37 M
AI analyses produced

Live since 4 August 2026. Figures measured on 30 September 2026, on a single server.

How it works

From feed to briefing

CONNEXUS

1

Collect

Every few minutes, from 4,577 feeds.

Duplicates removed by URL and content hash. Feeds that stop answering are deactivated automatically.

2

Resolve

The publisher's country and the article's language are decided separately, then translated.

A keyword gate decides what is worth sending to the model — this is what keeps the cost of AI finite.

3

Analyse

Relevance, entities and sentiment.

Open-weight models on our own hardware; two of them in rotation, with automatic failover.

4

Deliver

In minutes, not in a weekly report.

Live feed, alerts, the ATLAS map, written analyses, the assistant and the daily audio bulletin.

The hidden trap is in step two: a publisher's country and an article's language are two different questions. A system that treats them as one produces nonsense.

Technological sovereignty

The model runs in our own building

No external AI service

Open-weight language models run on our own hardware. Not one article, question or answer is sent to a foreign cloud for analysis.

0 articles sent outside

Cost that does not grow with success

The marginal cost of an article is electricity, not tokens. 13,757 AI analyses a day at a fixed, predictable cost.

13,757 AI analyses a day

Continuity we control

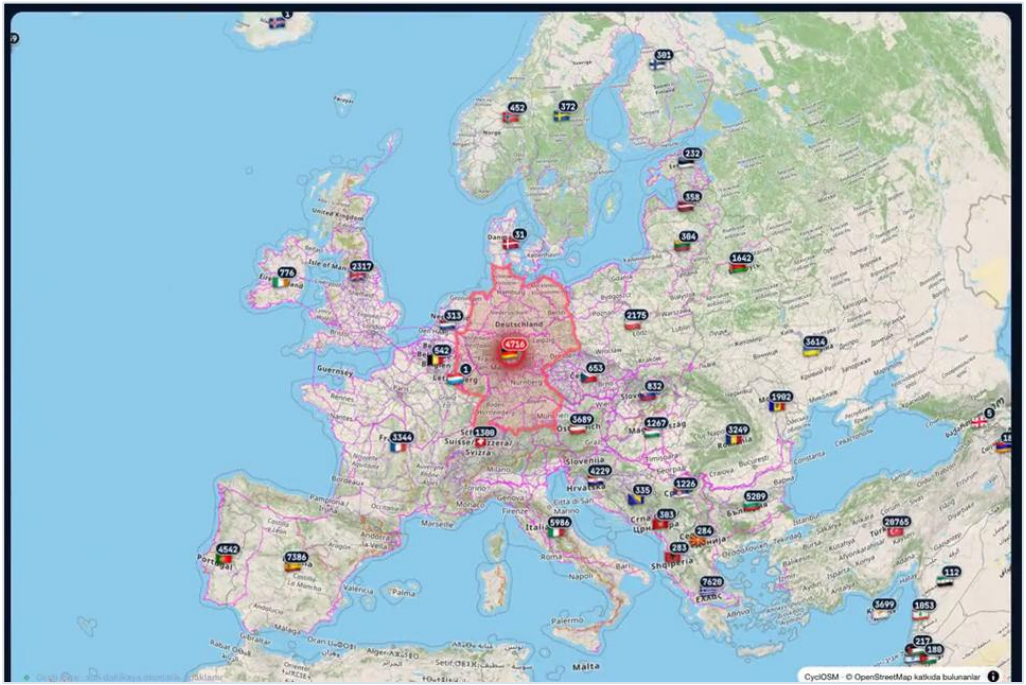

No vendor can deprecate our model, change its terms or cut us off. Two models run in rotation with automatic failover.

2 models, automatic failover

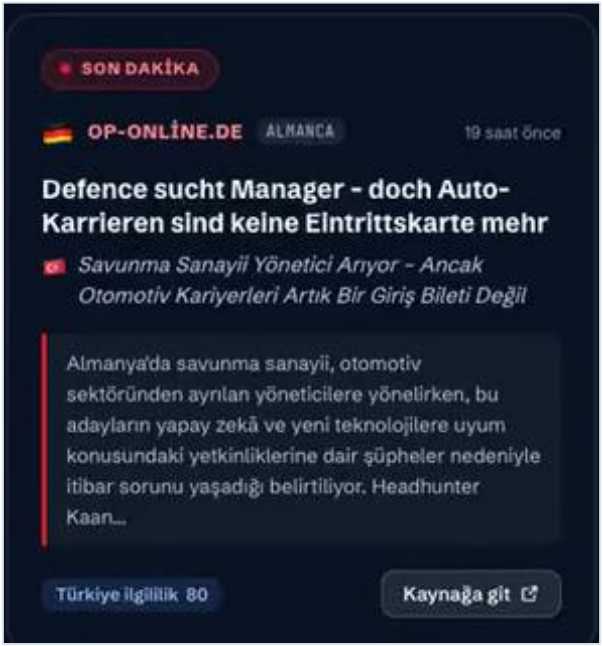

Architecture: a TypeScript service layer, a columnar analytics store, open-weight language models and local neural text-to-speech — all on premises.

The product

230,000 articles, one screen

ATLAS — the live world media radar. Article volume per country, updated continuously; clicking a country opens what it is publishing right now.

Every claim is traceable. One card, enlarged: a German headline, its Turkish translation, a relevance score, and a link straight back to the original.

Beyond reading

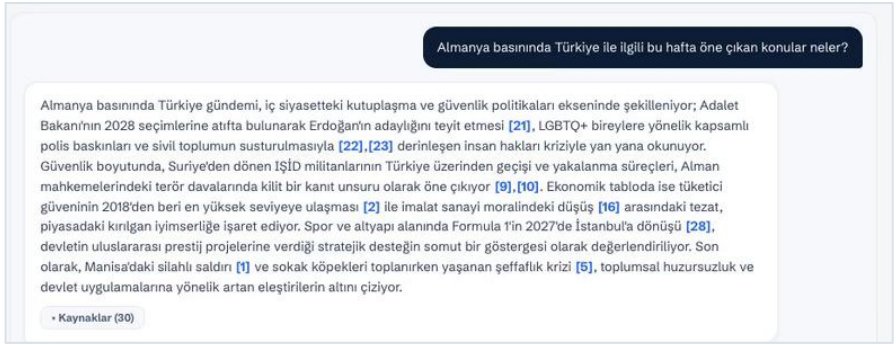

Don't read it. Ask it — or listen to it.

Two ways out of the reading problem, both on the same on-premise models.

The assistant — answers in natural language — "How was the Development Road project covered in the Gulf press this week?" — using only articles in the database, with every source attached.

The daily bulletin — is generated as audio by a local speech model: a 45-second briefing for the commute instead of 200 articles.

Nothing leaves — the building — no question, no answer, no transcript.

Every answer carries its sources — thirty articles stand behind this one.

What we learned the hard way

CONNEXUS

Four lessons from running AI in production

1 Automatic discovery needs a brake

Unbounded RSS discovery grew to 3.8 million "sources" and took the database down. A cap plus automatic deactivation brought it back to 5,900 real feeds.

2 The database has a ceiling — it will find you

At peak, 54% of inserts were being rejected outright. A concurrency limit and a retry queue turned silent data loss into a queue that drains.

3 A wrong translation is a wrong decision

A smaller model once rendered a national project's name as another country's programme. Temperature 0 and a pinned primary model ended it.

4 A domain is not a country

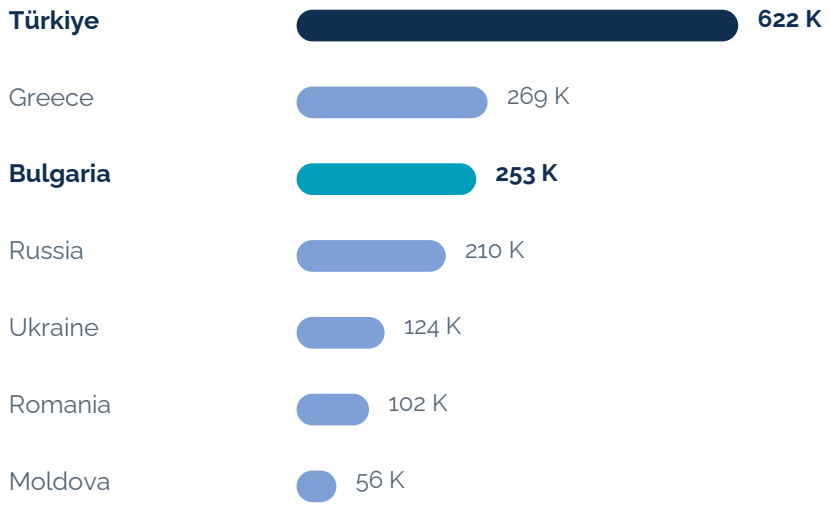

A Turkish outlet on a .co domain was filed under Colombia. Generic suffixes carry no geography; 806 articles had to be re-attributed.

Why this matters here

The Black Sea is one information space

Not a claim — a measurement. What our archive already holds from this region, all of it openly published media:

Bulgaria alone: 576 publishers, 110 active feeds — Bulgarian is the 11th most-collected language in the system — ahead of French. A story that breaks in Varna is readable in Ankara in minutes, and the reverse is just as true. That shared space is an argument for working together on it.

1.65 million articles · 6,371 publishers

What we can offer

Built once, useful to many

Ready today

A read-only public API — over the collected archive — search and filter by country, language, source and date.

The method — how country and language are resolved, how relevance is scored, how AI cost is kept bounded.

A working reference — for a sovereign AI deployment: what it costs, what it takes, and what breaks.

Worth exploring together

Regional narrative monitoring — with each side keeping its own data on its own servers.

Language coverage exchange — Bulgarian, Romanian, Greek and Turkish sources are complementary, not competing.

Open-weight models for smaller languages — a natural joint agenda with ICT Cluster Varna and BRAIN++.

Our AI runs where we can see it.
